

Our SHE goals and performance

Transport

Freight transport poses a major challenge in terms of both environmental impacts and road safety. To be sustainable, transport needs to have little or no environmental impact. However, with growing freight and passenger transport, pollution and congestion risk is aggravating.

Reporting on the carriage of goods includes all products of a chemical nature (finished products, raw materials, intermediates, samples, waste, etc.), which were transported from a Roche Group company to a customer's premises. Apart from the quantities carried, reporting also includes incidents with significant impact in terms of damage, injuries or publicity.

With 223,744 tons of goods transported in 2017, road transport accounted for the largest proportion at 61.7%, followed by air at 14.8% which transported 33,018 tons. Total amount of goods transported was 3.7% less than in the previous year.

Modes of transport 2017
