

Our SHE goals and performance

Waste Management

Waste, in particular landfilled waste, is a parameter of our eco-balance. It comprises inert chemical and reactor waste as well as construction waste. Roche has two goals:

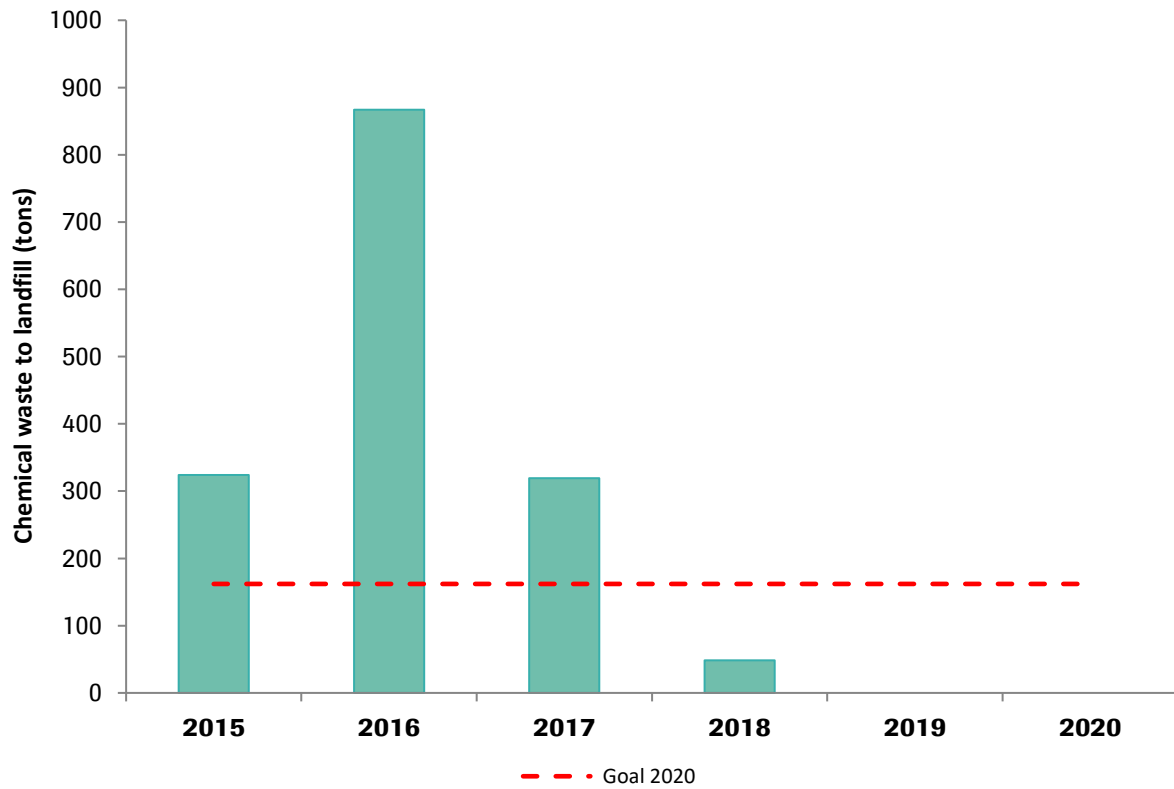

1. Reduce landfilling of chemical waste (organic chemicals) by 50 % (2015 to 2020); absolute tons (without green waste, slag/ash, inorganic material)
2. Reduce General waste in kg per employee (without construction waste) by 10 % (2015 to 2020)

General waste per employee

395 kg/employee of general waste was generated in 2018. This represents a decrease of approx. 9% since initiating the goal in 2015. We remain on track to achieving our 2020 goal.

Organic chemical waste to landfill

In 2018, 48.3 t of organic chemical waste was sent to landfill. This is a decrease of approx. 85% over 2017 and exceeds the Roche target of 162 t by approx. 70%. Over the goal period chemical waste data has fluctuated as this metric is highly volatile significantly changing from year to year.
